

NCV4263-2C

200 mA LDO Regulator with Enable, Reset & Watchdog

The NCV4263-2C is a 200 mA LDO regulator with integrated reset watchdog functions dedicated for microprocessor applications. Its robustness allows NCV4263-2C to be used in severe automotive environments. The Enable function can be used for decrease of quiescent current down to max 10 μ A. The NCV4263-2C contains protection functions as current limit, thermal shutdown and reverse output current protection. The regulator provides also Watchdog, Reset function with adjustable Threshold and adjustable Power-on Reset Delay Time.

Features

- Output Voltage Option: 5 V
- Output Voltage Accuracy: $\pm 2\%$
- Output Current up to 200 mA
- Very Low Dropout Voltage
- Enable Function (10 μ A Max Quiescent Current when Disabled)
- Microprocessor Compatible Control Functions:
 - Reset with Adjustable Threshold and Adjustable Power-on Delay
 - Watchdog Function
- Wide Input Voltage Operation Range: up to 40 V
- Protection Features:
 - Current Limitation
 - Thermal Shutdown
 - Reverse Output Current
- AEC-Q100 Grade 1 Qualified and PPAP Capable
- These are Pb-Free Devices

Typical Applications

- Body Control Module
- Instruments and Clusters
- Occupant Protection and Comfort
- Powertrain

*-optional if Reset function is needed

PIN FUNCTION DESCRIPTION

| Pin No. SO-8 EP | Pin No. SO-14 | Pin Name | Description |
|-----------------|---------------------|-------------|--|
| 1 | 13 | V_{in} | Positive Power Supply. Connect ceramic capacitor to ground. |
| 2 | 14 | EN | Enable Input. Low level disables the chip. Connect to V_{in} if this function is not needed. |
| 3 | 1 | RO | Reset Output; Open Collector connected to the V_{out} via an internal 30 k Ω pull-up resistor; leave open if the function is not needed |
| 4 | 3, 4, 5, 10, 11, 12 | GND | Power Supply Ground. Connect pins to heat sink area with GND potential. |
| 5 | 6 | D | DelayTiming. Connect to GND via ceramic capacitor for adjusting reset delay timing and watchdog trigger time or leave open if this function is not needed. |
| 6 | 7 | RADJ | Reset Adjust Threshold. Connect to GND ($V_{RT} = 93\%$ of V_{out}) or to output voltage divider to adjust the reset threshold. |
| 7 | 8 | WDI | Watchdog Input. Rising edge triggered Input for watchdog pulses. Connect to GND if this function is not needed. |
| 8 | 9 | V_{out} | Regulated Output Voltage. Connect a $C_{out} \geq 22 \mu F$ capacitor to ground. |
| EPAD | - | Exposed Pad | Connect to ground potential or leave unconnected. |
| - | 2 | NC | Not connected. No internally bonded. |

DEFINITIONS

General

All measurements are performed using short pulse low duty cycle techniques to maintain junction temperature as close as possible to ambient temperature.

Output Voltage

The output voltage parameter is defined for specific temperature, input voltage and output current values or specified over Line, Load and Temperature ranges.

Line Regulation

The change in output voltage for a change in input voltage measured for specific output current over operating ambient temperature range.

Load Regulation

The change in output voltage for a change in output current measured for specific input voltage over operating ambient temperature range.

Dropout Voltage

The input to output differential at which the regulator output no longer maintains regulation against further reductions in input voltage. It is measured when the output drops 100 mV below its nominal value. The junction temperature, load current, and minimum input supply requirements affect the dropout level.

Quiescent and Disable Currents

Quiescent Current (I_Q) is the difference between the input current (measured through the LDO input pin) and the output load current. If Enable pin is set to LOW the regulator reduces its internal bias and shuts off the output, this term is called the disable current (I_{DIS}).

Current Limit and Short Circuit Current Limit

Current Limit is value of output current by which output voltage drops below 96% of its nominal value. It means that the device is capable to supply minimum 200 mA without sending Reset signal to microprocessor.

Short Circuit Current Limit is output current value measured with output of the regulator shorted to ground.

PSRR

Power Supply Rejection Ratio is defined as ratio of output voltage and input voltage ripple. It is measured in decibels (dB).

Line Transient Response

Typical output voltage overshoot and undershoot response when the input voltage is excited with a given slope.

Load Transient Response

Typical output voltage overshoot and undershoot response when the output current is excited with a given slope between low-load and high-load conditions.

Thermal Protection

Internal thermal shutdown circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When activated at typically 177°C, the regulator turns off. This feature is provided to prevent failures from accidental overheating.

Maximum Package Power Dissipation

The power dissipation level is maximum allowed power dissipation for particular package or power dissipation at which the junction temperature reaches its maximum operating value, whichever is lower.

APPLICATIONS INFORMATION

The NCV4263-2C regulator is self-protected with internal thermal shutdown and internal current limit. Typical characteristics are shown in Figures 4 to 22.

Input Decoupling (C_{in})

A ceramic or tantalum 0.1 μF capacitor is recommended and should be connected close to the NCV4263-2C package. Higher capacitance and lower ESR will improve the overall line and load transient response. If extremely fast input voltage transients are expected then appropriate input filter is recommended to use in order to decrease rising and/or falling edges below 50 V/μs for proper operation. The filter can be composed of several capacitors in parallel.

Output Decoupling (C_{out})

The NCV4263-2C is a stable component and requires a minimum Equivalent Series Resistance (ESR) for the output capacitor. Stability region of ESR versus Output Current is shown in Figure 13. The minimum output decoupling value is 22 μF and can be augmented to fulfill stringent load transient requirements. Larger values improve noise rejection and load transient response.

Enable Operation

The Enable pin will turn the regulator on or off. The threshold limits are covered in the electrical characteristics table in this data sheet.

Delay Timing

The Delay Timing pin is current source. Current from Delay Timing pin charges connected capacitor. The value of this capacitor determines the Reset Delay Time by Equation 1 and Watchdog Trigger Time by Equation 4.

$$C_D = \left(\frac{t_{RD_des}}{t_{RD}} \right) \times 100 \text{ nF} \quad (\text{eq. 1})$$

where:

- C_D is capacitance of Delay capacitor
- t_{RD_des} is desired Reset Delay Time
- t_{RD} is Reset Delay Time specified in datasheet

Reset Operation

A reset signal is provided on the Reset Output pin to provide feedback to the microprocessor of an out of regulation condition. The timing diagram of reset function is shown in Figure 21. This is in the form of a logic signal on Reset Output. Output voltage conditions below the Reset Threshold causes Reset Output to go low. The Reset Output integrity is maintained down to V_{out} = 1.0 V. The Reset Output circuitry is open collector output with internal 30 kΩ pull-up resistor. Leave open this output if the Reset function is not needed else an external pull-up resistor (5.6 kΩ) connect to the output (V_{out}).

Reset Threshold is default set to 93% of nominal Output Voltage (V_{RADJ} = 0 V). Reset Threshold can be varied in

range of Output Voltage 70% ≤ V_{out} < V_{RT} by external resistor output voltage divider, see schematic on Figure 23 and specification of Reset Output.

Figure 23. Application Schematic with Adjustable Reset Threshold

Desired Reset Threshold is given by Equation 2.

$$V_{RT_des} = \left(\frac{R_{RADJ1} + R_{RADJ2}}{R_{RADJ2}} \right) \times V_{th(RADJ)} \quad (\text{eq. 2})$$

where:

- V_{RT_des} is desired Reset Threshold
- R_{RADJ1}, R_{RADJ2} are resistance of resistor divider
- V_{th(RADJ)} is Reset Adjust Threshold specified in datasheet

Use R_{RADJ2} ≤ 50 kΩ to avoid significant Reset Threshold error due to RADJ bias current.

Watchdog Operation

Watchdog Input monitors a signal from microprocessor. This input is positive edge sensitive. The timing diagram of watchdog function is shown in Figure 22. When watchdog signal is not received during Watchdog Trigger Time, Reset Output goes low for a Watchdog Input Low Time and is periodically generated with period given by Equation 3. Capacitance of Delay capacitor for setting the desired Watchdog Trigger Time is given by Equation 4.

$$t_{WP} = t_{WL} + t_{WTT} \quad (\text{eq. 3})$$

$$C_D = \left(\frac{t_{WTT_des}}{t_{WTT}} \right) \times 100 \text{ nF} \quad (\text{eq. 4})$$

where:

- C_D is capacitance of Delay capacitor
- t_{WTT_des} is desired Watchdog Trigger Time
- t_{WTT} is Watchdog Trigger Time specified in datasheet
- t_{WL} is Watchdog Input Low Time
- t_{WP} is Watchdog Input Period

Thermal Considerations

As power in the NCV4263-2C increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent

NCV4263–2C

upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. When the NCV4263–2C has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power applications. The maximum dissipation the NCV4263–2C can handle is given by:

$$P_{D(MAX)} = \frac{[T_{J(MAX)} - T_A]}{R_{\theta JA}} \quad (\text{eq. 5})$$

Since T_J is not recommended to exceed 150°C , then the NCV4263–2C soldered on 645 mm^2 , 1 oz copper area, FR4 can dissipate up to 1.3 W in SOIC–14 package and 1.9 W in SOIC–8 EP package, when the ambient temperature (T_A) is 25°C . See Figures 24 and 25 for $R_{\theta JA}$ versus PCB area. The power dissipated by the NCV4263–2C can be calculated from the following equations:

$$P_D \approx V_{in}(I_q @ I_{out}) + I_{out}(V_{in} - V_{out}) \quad (\text{eq. 6})$$

or

$$V_{in(MAX)} \approx \frac{P_{D(MAX)} + (V_{out} \times I_{out})}{I_{out} + I_q} \quad (\text{eq. 7})$$

Hints

V_{in} and GND printed circuit board traces should be as wide as possible. When the impedance of these traces is high, there is a chance to pick up noise or cause the regulator to malfunction. Place external components, especially the output capacitor, as close as possible to the NCV4263–2C and make traces as short as possible.
